

# Confidence in real-time forecasting of morphological storm impacts

Fedor Baart and Pieter van Gelder and Mark van Koningsveld

May 8, 2011

# Introduction

Fedor Baart

PhD thesis: Confidence in morphological forecasts

1 Coastal safety along the Dutch coast

2 Days ahead

3 Confidence

# Outline

1 Coastal safety along the Dutch coast

2 Days ahead

3 Confidence

# The Netherlands below sea level

## Elevation

40% Of the Netherlands is below sea level.

# How safe should it be?

## Norm

Dutch safety standard of 1/10000 (exceedance probability for the Holland Coast per year) is based on economic evaluation of the hinterland.

# Outline

1 Coastal safety along the Dutch coast

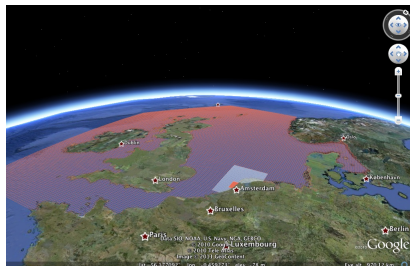

2 Days ahead

3 Confidence

# Operational modelling

## Forecasts

Predicting coastal changes 3 days ahead.

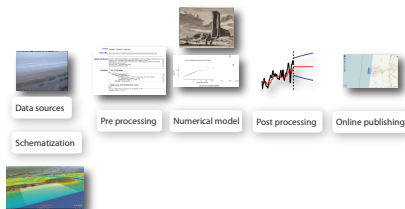

**Figure:** Operational model for coastal morphology (Baart et al 2009)

# Operational modelling

## Forecasts

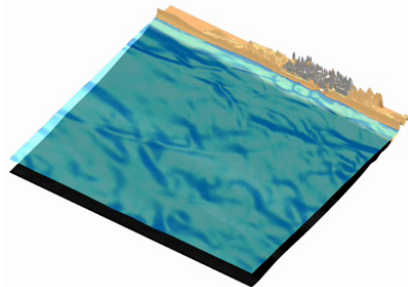

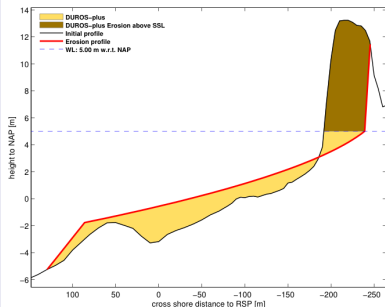

Improvements to several aspects of the operational coastal morphological model.

**Figure:** Improvements to several aspects of the operational coastal morphological model.

# Improving the coverage

From local empirical model (applicable to 60%) to a general numerical model (applicable to 90%)

**Figure:** Duros 1D model versus XBeach 2D model,  
<http://www.xbeach.org>

# Open Source models

## Delft3D

Open source modules: FLOW, MOR, WAVE.

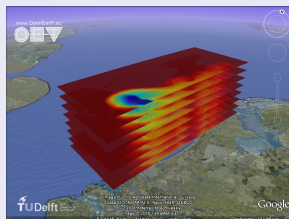

Figure: Delft3D simulation of Rhine rofi, source: De Boer, <http://oss.deltares.nl>

## OpenEarth

Collaboration to share data model and tools.

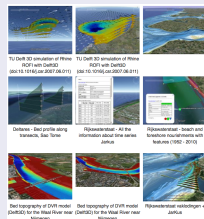

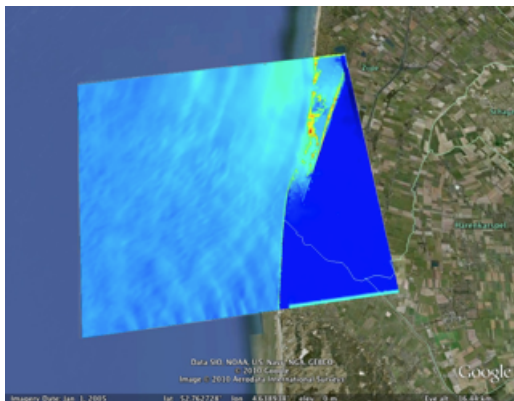

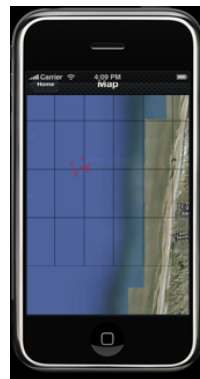

Figure: Visualizations made with OpenEarthTools, <http://www.openearth.eu>

# Operational modelling

**Figure:** Forecasting water levels and currents nearshore and erosion

**Figure:** Swimmer simulator

# Response measures

Figure: Twee gebroeders, 1953

Figure: Research: Emergency measures Delfland Walstra et al

movie

**Figure:** XBeach model of Petten met hyperstorm ( $p < 1/10000$ ).

# Outline

1 Coastal safety along the Dutch coast

2 Days ahead

3 Confidence

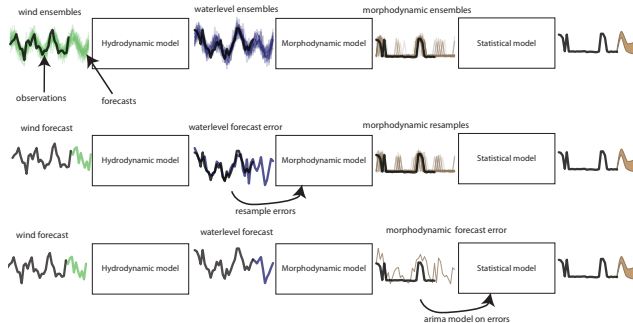

## Main question

How confident are we in our forecasts?

### 3 methods

- *Ensembles propagation*
- Hydrodynamic forecast error
- Morphological forecast error

### 3 Methods

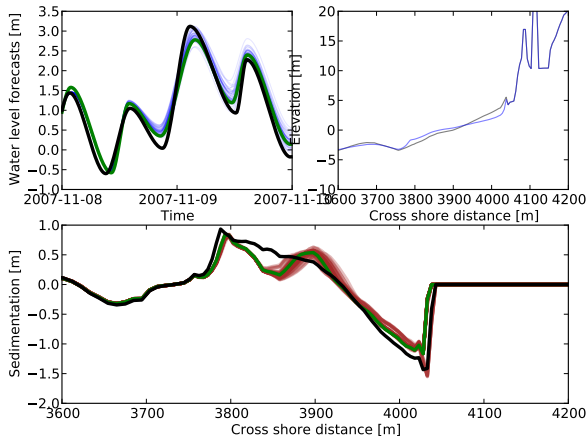

**Figure:** Methods to estimate confidence interval

## Example: Egmond coast

movie

Figure: XBeach model of Egmond 2007 storm.

## Ensemble method

# Applicability

Method	Error introduction	Data required	Computation time	Assumptions
(a)	Meteorological	Ensemble breeding	6 hours * 50	Ensemble variation propagated through model chain is representative for the error made in morphological forecast.
(b)	Hydrodynamic	History of hydrodynamic observations and forecasts	4 hours + 2 hours * number of resamples (50)	Previous hydrodynamic forecast errors are representative and the main source for errors in the morphological forecast
(c)	Morphodynamic	History of morphodynamic observations and forecasts	6 hours	Previous morphodynamic forecast errors are representative for future forecast errors.

**Table:** Comparison of the three different methods to compute confidence bounds
