

Towards resilient groundwater and surface water management in New Orleans

Roelof.stuurman@deltares.nl

November 2018, Field borehole campaign

Climate change

- Accelerated sea level rise
- Extreme weather events

Socio-economic development

- Urbanization and population growth
- Increased water demand

Sea level rise
3 - 10 mm/year

Subsidence
6 - 100 mm/year

Impacts

- Increased flood risk
- Damage to buildings, infrastructure
- Disruption of water management

Causes

- Groundwater extraction
- Oil, gas, coal mining
- Tectonics

A 3 scales approach

City as a Sponge

Absorbing runoff into the ground

Natural Landscape
Soil and vegetation naturally absorb 90 percent of rainfall through infiltration into the ground and evapotranspiration into the air. Plants on the delta, like bald cypress and swamp iris, have adapted to live in a wet landscape.

Hard City Surfaces
Asphalt, pavement, and roofs rapidly shed water, creating huge volumes of fast flowing runoff. Developed areas create over 500 percent more runoff than natural areas of the same size.

City as a Sponge
The living system uses trees, greenspace, porous paving, and other soft infrastructure to slow and absorb runoff before it causes flooding.

3. Prepare a subsidence vulnerability map of New Orleans

Deliverables mapping

1. Dataset of borehole descriptions.
2. Freeboard map that shows the shallow drainage depth in New Orleans (in different depth classes), including explanatory text.
3. Organic matter content map of the shallow surface of New Orleans (different classes), including explanatory text.
4. Potential subsidence (vulnerability) as a result of oxidation of organic matter map of New Orleans under business as usual, including explanatory text. Subsequent maps may be produced based on different groundwater management scenarios (these maps will be mostly qualitative).
5. Stakeholder workshop in which maps are being explained and promoted.
6. Papers: at least one in popular scientific magazine/website.

**Field campaign November 11th – 18th
In cooperation with Tulane University**

Contract : 63 boreholes
Our planning: 75 boreholes
Realization: 72 boreholes

Preparation in Utrecht;

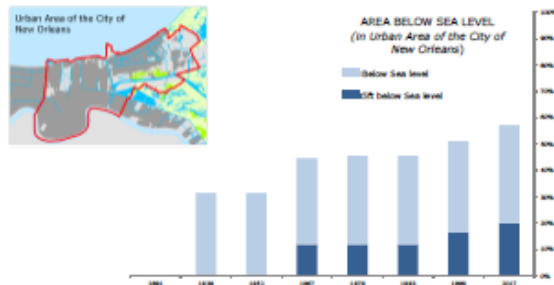

- ***Determination locations,***
- ***Ordering reserve augers etc.,***
- ***Buying sample equipment,***
- ***pH, EC meters***
- ***Organizing databasing,***
- ***Organizing borehole description (the Tulane way)***

More boreholes in Gentilly *Working with 3 drilling teams*

NOTE: Graphic Logo in Development

PREPARATION:

Analyzing historical topographical maps

- Drainage system
- Change in elevation

Next step: distribution of levees in time

OUR TEAM

TULANE:

- Ryan Clarke (LSU)
- Molly Keogh (PhD-study)
- Udita Mukherjee (PhD-study)
- Tor Tornqvist (prof)
- Alex Kolker (LUMCON)

DELTARES:

- Sanneke van Asselen,
- Gilles Erkens,
- Peter Vos,
- Marc Hijma,
- Roelof Stuurman

BATTURE:

- Chris Rutland

**Daily strategy 7:00 a.m. breakfast at Avenue Cafe,
Lunch around noon, returning at dark (5 p.m.), databasing**

Cross section D-D' (USACE 1958)

Peat disappeared

Preliminary conclusions;

- The inventory was successful;
- Peat at surface is nearly gone with the exception of Lakeview;
- Still peat levels below MLG
- Still a lot of soft (and organic) clays

Some additional observations
