1. Introduction

Halifax Inlet enjoys a variety of uses which include:

- Recreation
- Military
- Shipping
- Fishing
- Research activities

2. General Physical Oceanography of Halifax Inlet

Schematic of Two-layered Estuarine Flow in Halifax Inlet

Storm Surge & Coastal Upwelling

<http://bbomb.ceotr.ca/images/processedData/webImages/satellite/WaterTemperature.png>

Main Scientific Issues to be Addressed:

- What is the seasonal variability of TS in Halifax Inlet?
- How does the inlet respond to tides, wind, freshwater discharge?
- What is the dispersion rates in Halifax Inlet?

3. Nested-grid Coastal Circulation Model

Nested-grid Coastal Ocean Prediction System (NCOPS-HFX)

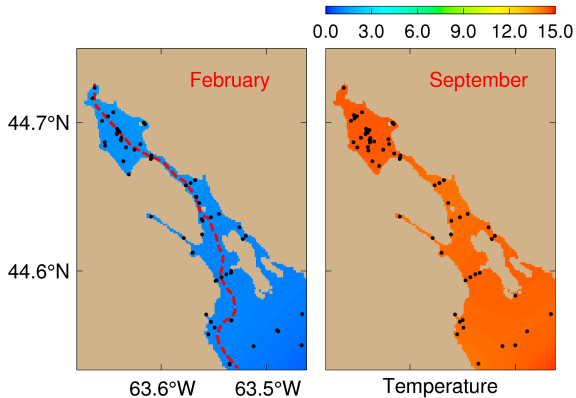

Main Features of NCOPS-HFX:

- Five submodels with different horizontal resolutions
- Based on Dalcoast (POM) and CANDIE
- Driven by WebTide and meteorological forcing, heat flux, water discharge
 - 1-hourly surface elevation and depth-mean currents along the open boundary of submodel 2 (submodel 1, WebTide and seasonal mean climatology)
 - 3-hourly numerical weather forecasts wind (MSC)
 - 6-hourly surface heat flux (NCEP Reanalysis data)
 - Daily observed Sackville River discharge
 - Constant fluvial and sewage effluent along the coastline of Halifax Inlet
- One-way nesting
- Operational capability

Monthly Mean TS Climatology

Constructed using [Barnes' algorithm](#) from $\sim 500,000$ points of TS observations ranging from year 1915 to 2008 including:

- Weekly or bi-weekly CTD surveys in Halifax Inlet between year 2004-2007 (HHWQMP) 80%
- Hydrographic Climate Database between year 1915-2008 (Fisheries and Oceans Canada, DFO) 20%

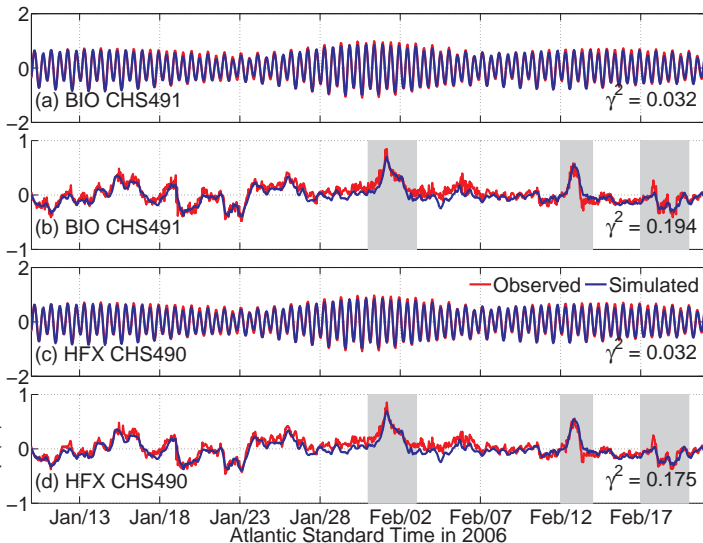

Comparison of Tidal & Non-tidal Sea Levels

Tidal

Non-tidal

Comparison of Tidal Currents

Submodel 4
(each 10 points)

WebTide
(actual points)

Comparison of Tidal Currents

Submodel 5

WebTide

Comparison of Surface T & S

With wind

Without wind

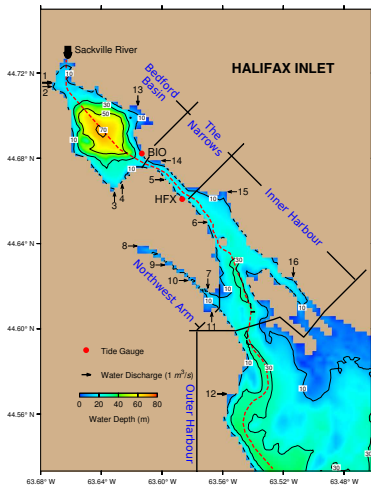

4. Dispersion in Halifax Inlet

3D Passive Particle Tracking

Movements of particles (based on instantaneous baroclinic currents, Feb 2006)

Dynamic Connectivity

Day: 32

Day: 49

Summary

- A 5-level nested-grid ocean circulation model (NCOPS-HFX) was used in simulating the 3D circulation and hydrographic distribution in Halifax Inlet.
- Model results were compared with tide gauge, WebTide and T&S Climatology in Halifax Inlet.
- Model results show coastal circulation and hydrographic distribution in Halifax Inlet are affected significantly by wind, especially during storm period.
- Dispersion and dynamic connectivity in Halifax Inlet were investigated based on particle tracking experiments.
