

Morphological modelling of an intertidal flat nourishment in the Eastern Scheldt, The Netherlands

Katherine Cronin (Deltares), **Bas Borsje** (Deltares),
Harriëtte Holzhauser (Deltares), **Ilse de Mesel** (IMARES),
Tom Ysebaert (IMARES) and **Anneke Hibma** (EcoShape)

Eastern Scheldt estuary

- Legend**
- Netherlands
 - Eastern Scheldt
 - Galgeplaat
 - Zeeland bridge
 - Storm surge barrier
 - Nourishment

- = Salt-marsh
—— = Mean low water line

Main concerns:

Sediment starvation, Nature Conservation, Safety

Erosion --- barrier and compartment dams.

Drowning -- sea level rise

Total 1 - 3 Mm³ per year lost

11,000 ha in 1986
10,000 ha now
4 -6,000 ha in 2060

- Restore morphological equilibrium
- Dismantle barrier
- Dismantle barrier + compartment dams
- Natural transport of sand through the barrier
- Mitigate erosion

To investigate these solutions:

4/18

- EcoShape: Building with Nature:

Deltares investigating **ecodynamic** solutions to mitigate tidal flat degradation in the Eastern Scheldt with **Rijkswaterstaat**

- ANT project (Autonomous Downward Trend)
commission by Rijkswaterstaat

Provide scientific knowledge on the feasibility and cost of reaching the **Natura 2000 targets** for the Eastern Scheldt Estuary

The Galgeplaat intertidal shoal

5/18

- Tidal flow at present does not allow shoal building
- Locally generated waves have a large impact on sediment transport and degradation of the intertidal areas
- Areas between +1 and -1 NAP eroding and higher areas flattening and spreading out

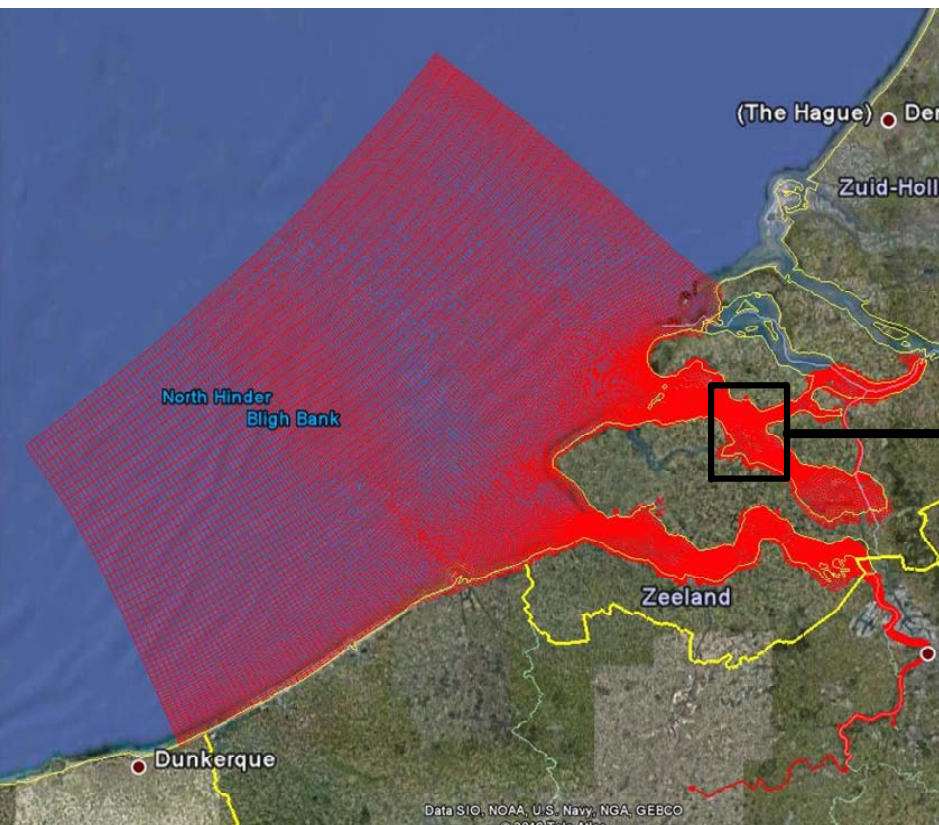

Intertidal flat nourishment

6/18

- 2DH hydrodynamic model of the Galgeplaat – 25-45m grid resolution
- Nested in the KustZuid model- simulates currents and waves of southern north sea
- Waves simulated using SWAN

Galgeplaat morphological model

8/18

0.5 minutes

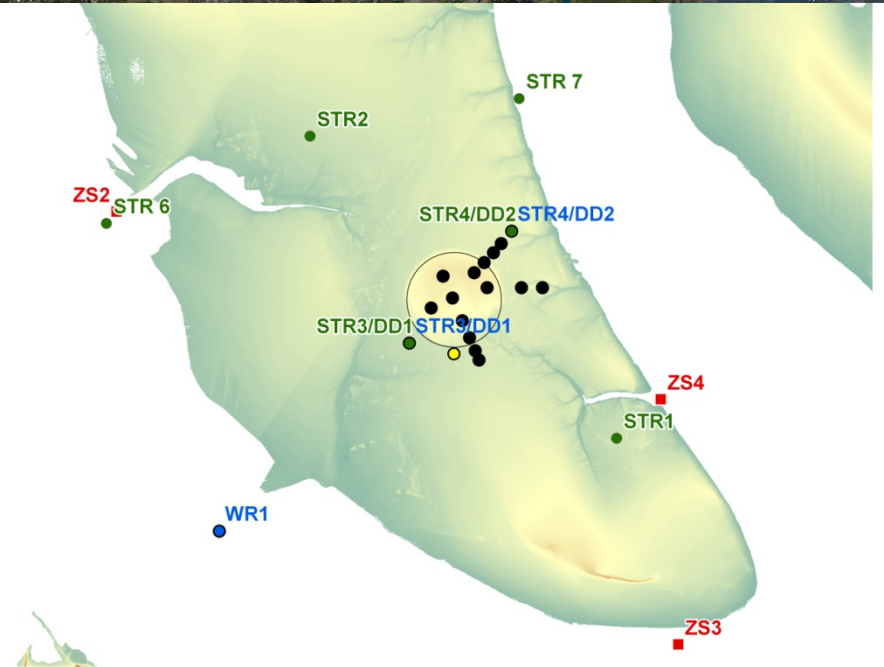

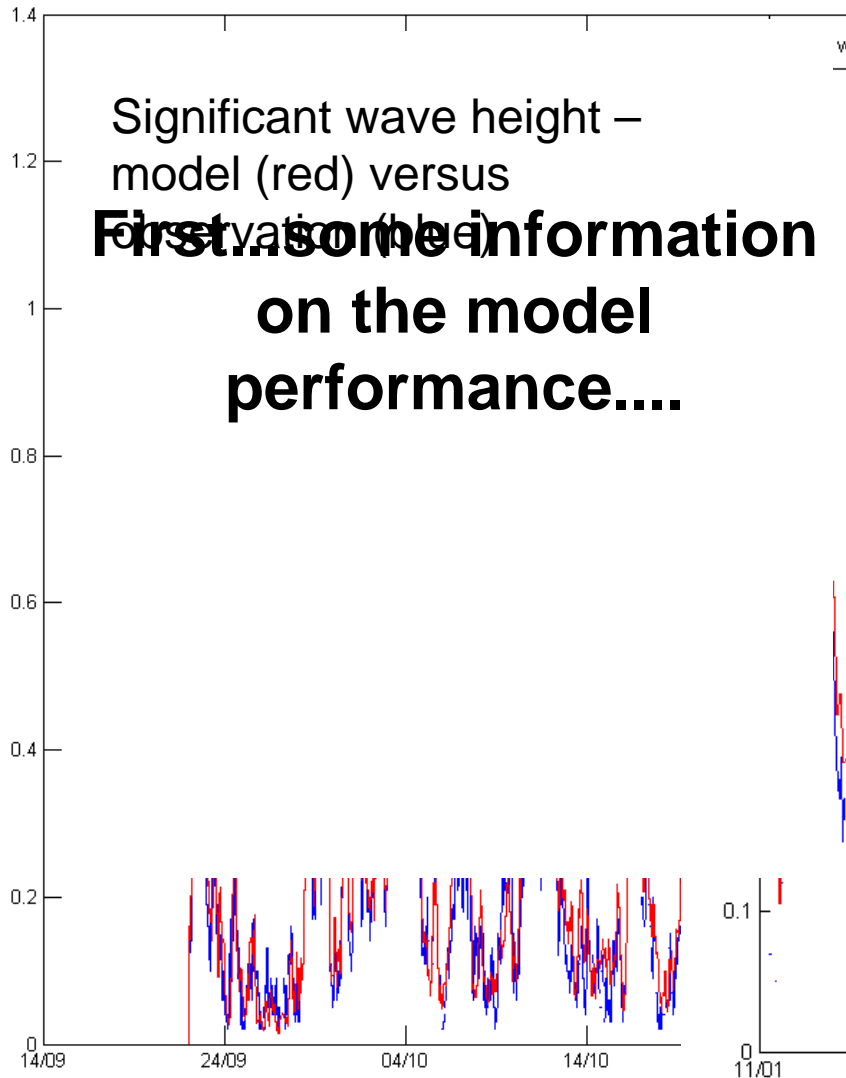

1 sediment fraction –
200 μm

Chezy coefficient of 65

Morphological factor of 6

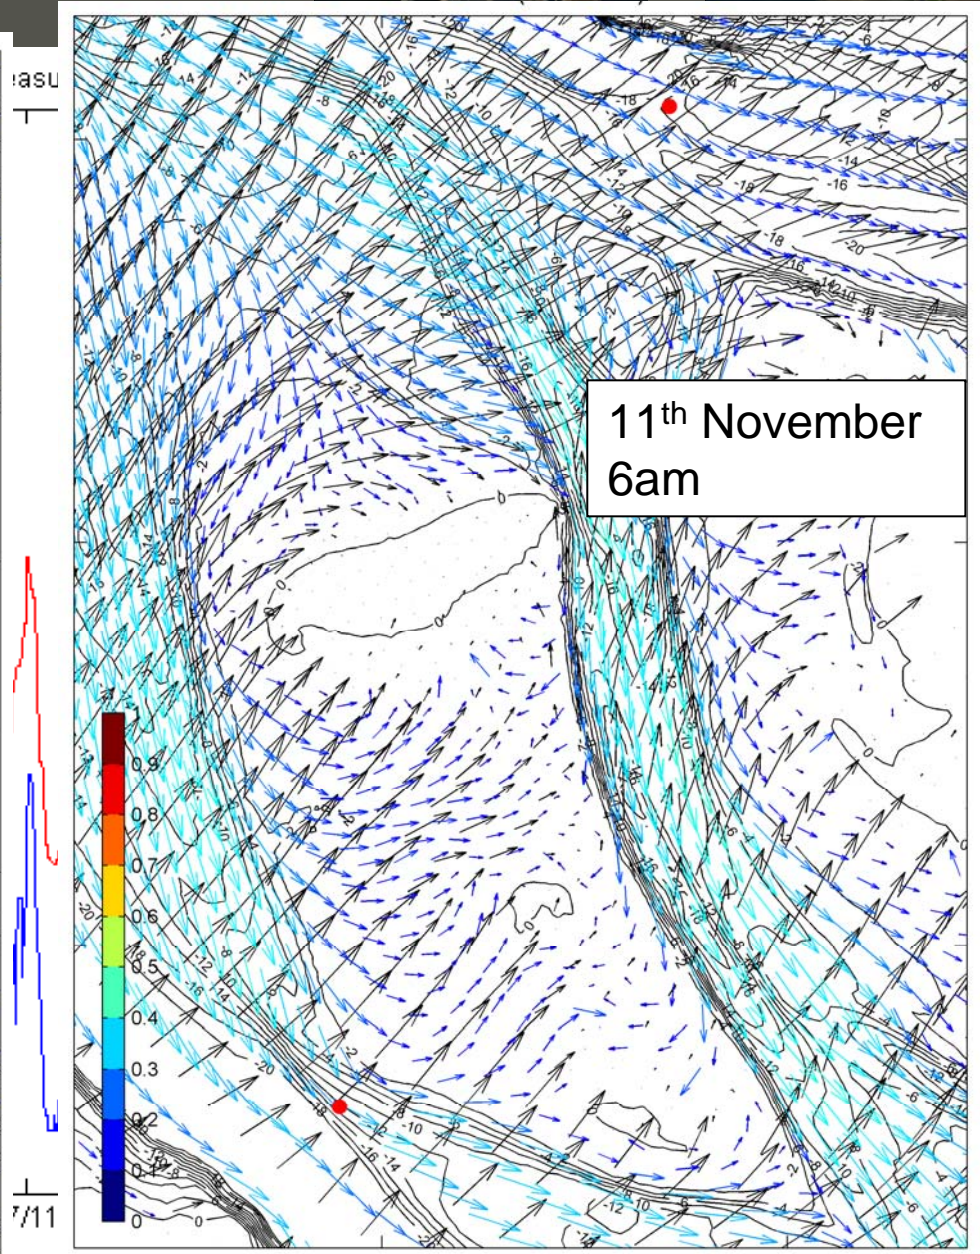

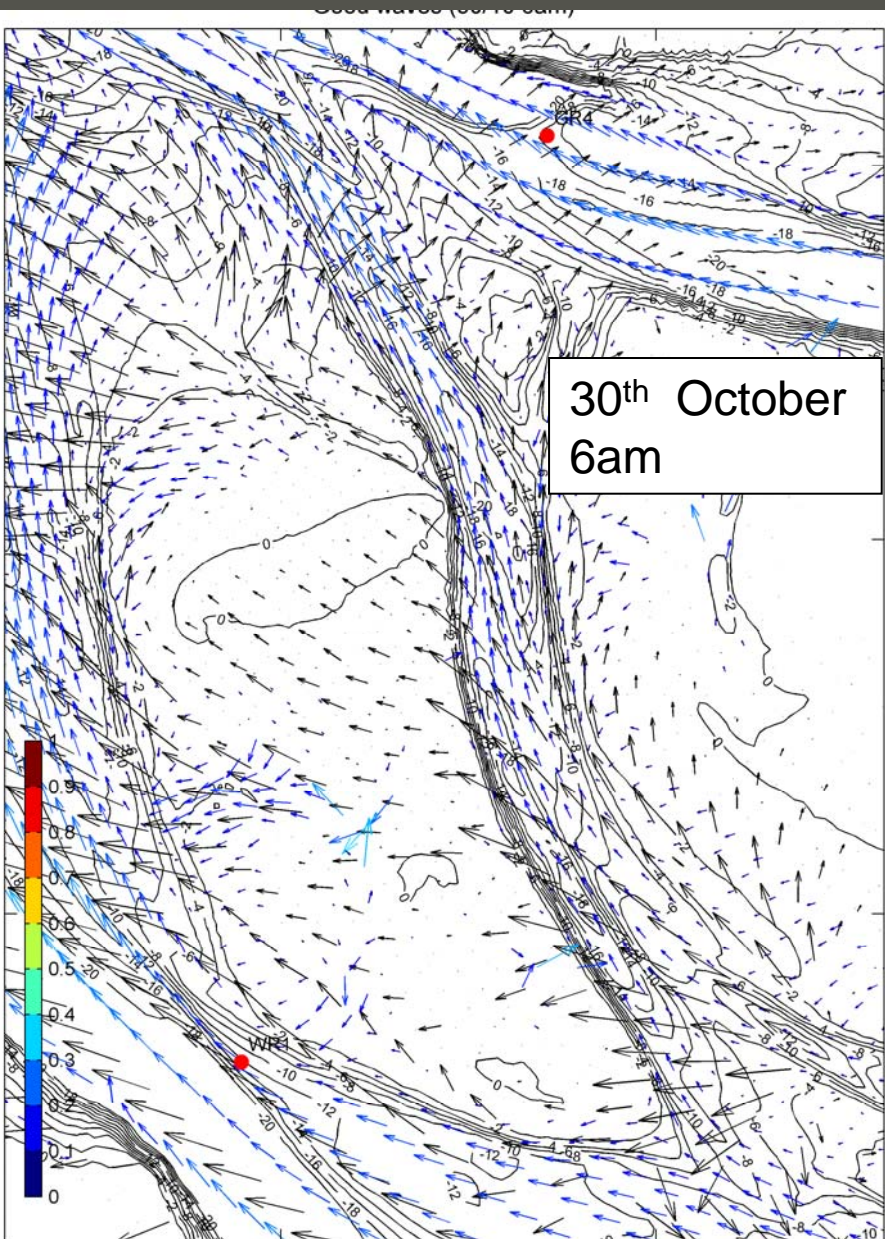

Waves – NE

Significant wave height –
model (red) versus
First, some information
on the model
performance....

Waves SW

10/18

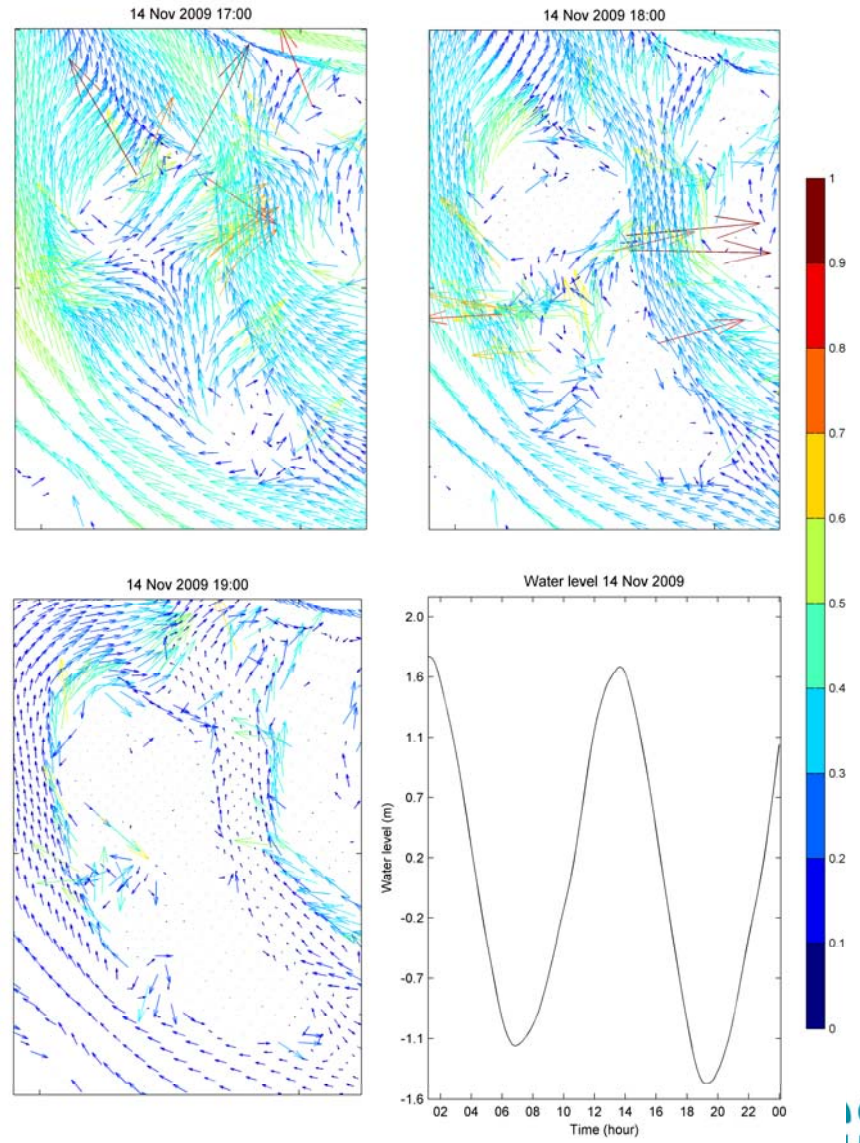

Currents (m/s -- blue observation, red model)

11/18

Flow fields

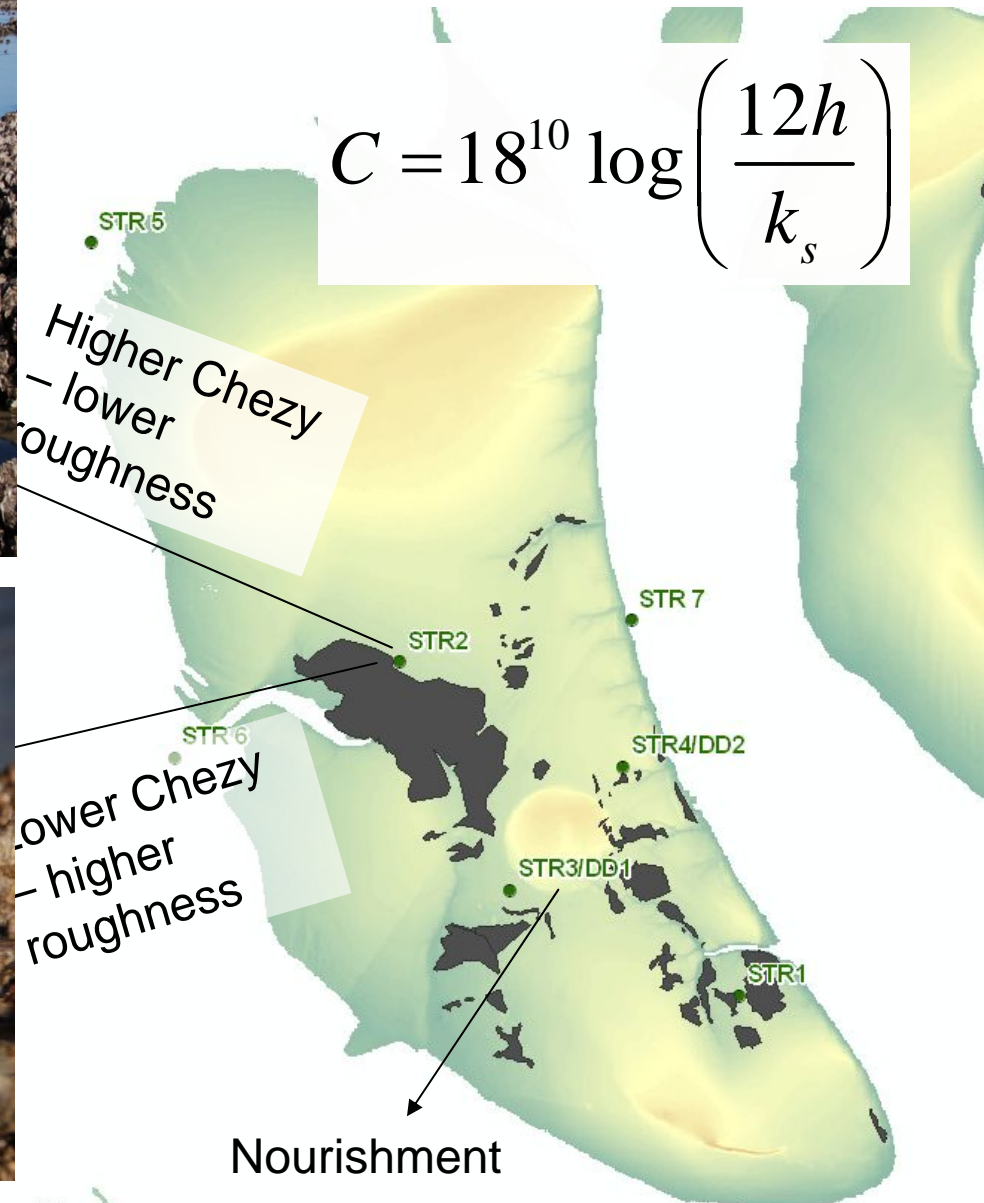

Biological roughness effects

10/17

10/19

10/21

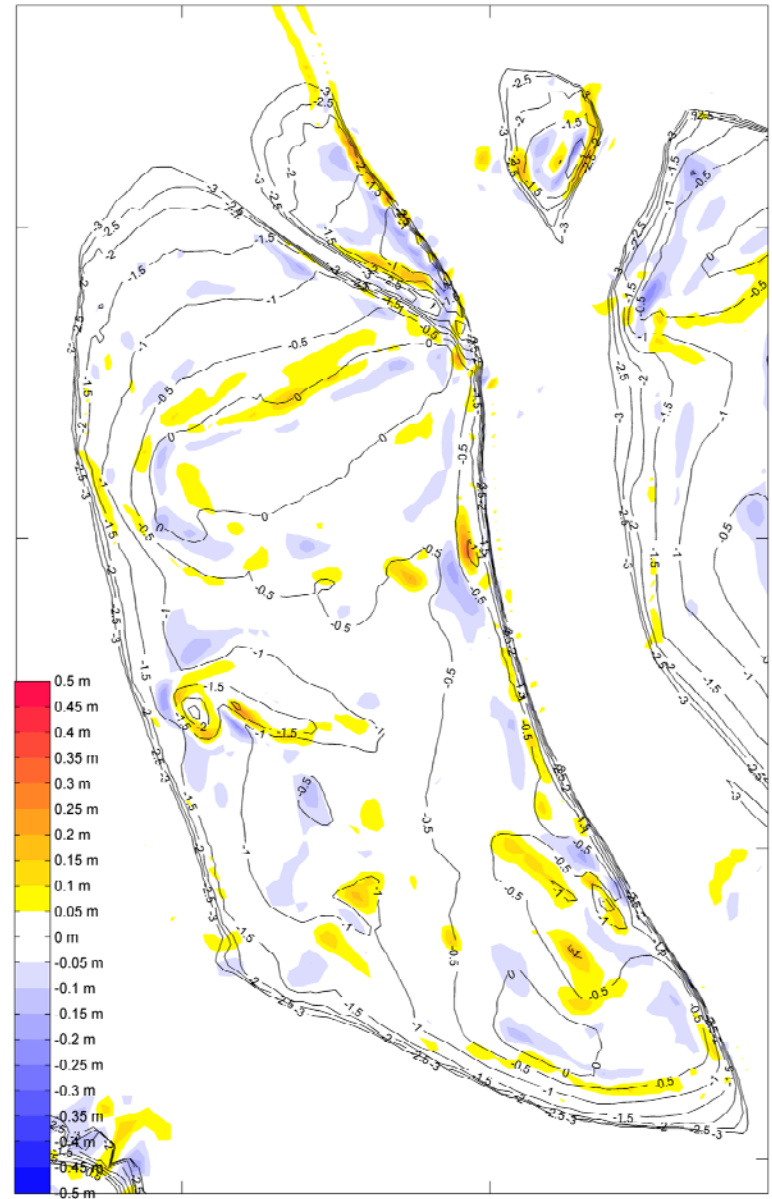

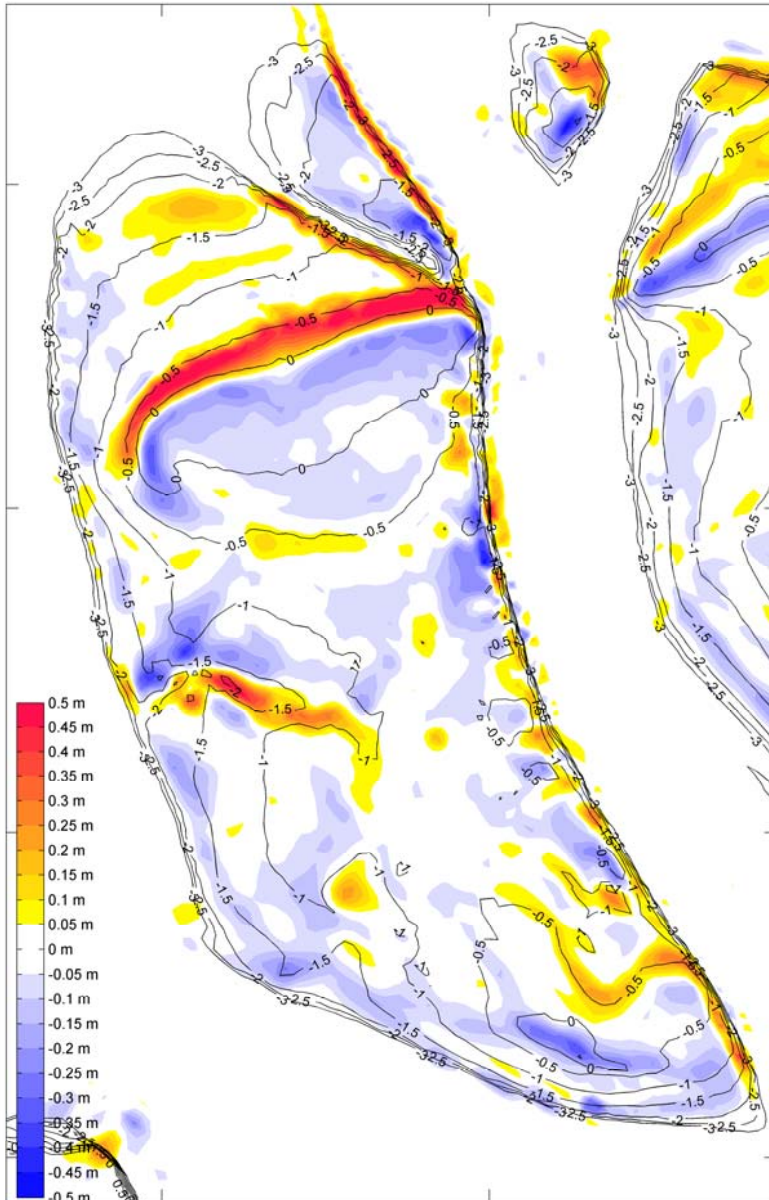

$$C = 18^{10} \log\left(\frac{12h}{k_s}\right)$$

Higher Chezy
- lower
roughness

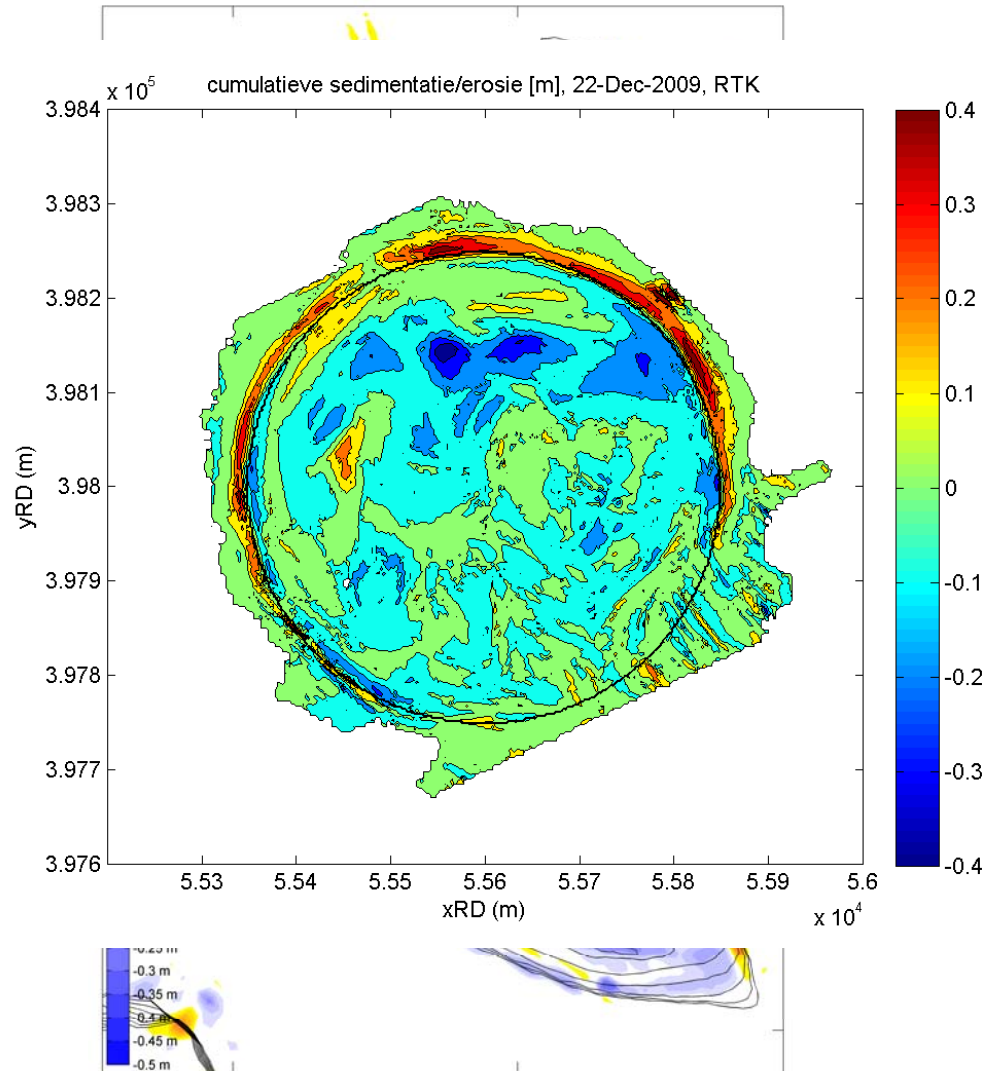

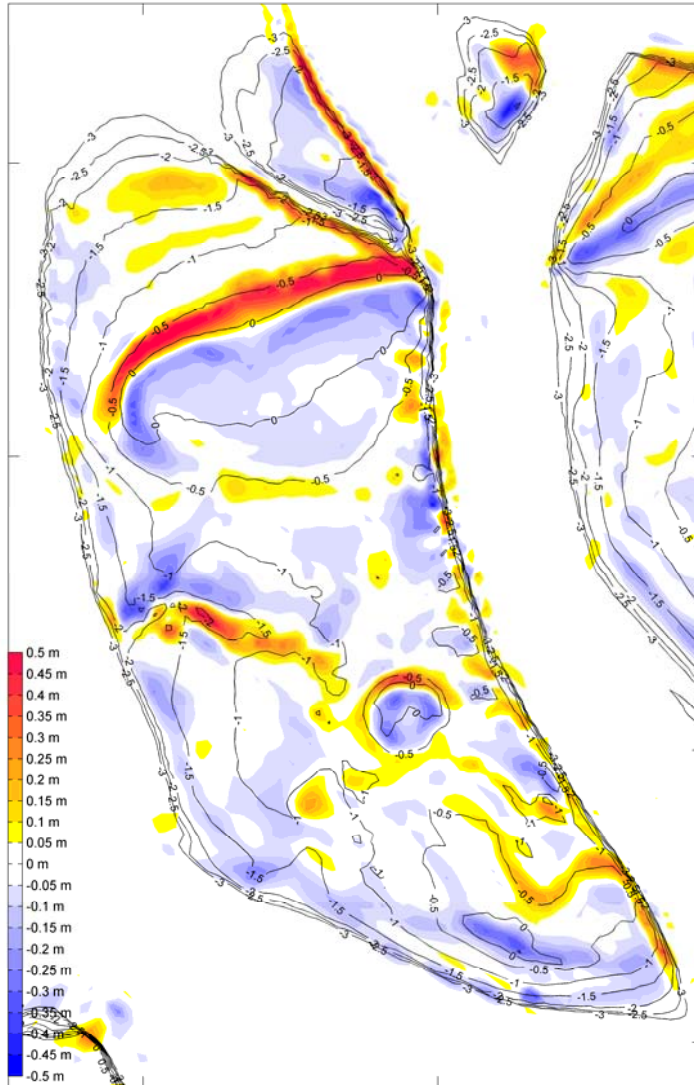

Lower Chezy
- higher
roughness

Nourishment

Nourishment scenarios

15/18

Nourishment scenarios

Comparison to measurements

SET = RTK measurements monthly

Bed level at SET 102

Time

- Both **wind and current direction** play a role in the correct simulation of significant wave heights on and around the Galgeplaat
- **Morphological patterns** are partly in agreement with observations that show western edge eroding and sediment building up on eastern edge of the flat
- Although the correct **order of magnitude of erosion** is simulated further work necessary to improve the results at specific locations
- Better implementation of **bio-geomorphological effects**
- Model is a **useful tool to test different nourishment strategies** and examine the **driving processes** of sediment distribution i.e. Suspended sediment transport patterns correlate with significant wave height → locally generated waves play important role
- Effectiveness of the nourishment influenced by both **location and bed level**
- Much more to improve – longer term behaviour, grain size variation etc etc....
.....to be continued.....

Thank You / Merci – Questions?
