- North from 39.5°N
- Forced by OGCM : INGV-MFS SYS3a2 SYS4 ou Mercator
- Atmospheric forcing is a zoom of MM5 model embedded in NCEP
- Free run
- Resolution about 1.2 km /30 sigma levels
- **Operational Purpose** : PREVIMER / (ANR CLARA II)
- **Research purpose** : Physics (mesoscales processes), Biology/Contaminants (ANR COSTAS /eco3m), halieutics (SARDONE EU-PROJECT), Climatology (fondation Total /CLIMCARE), Downscaling, spectral nudging (PPR Mercator ).

# The MENOR configuration of Mars3d

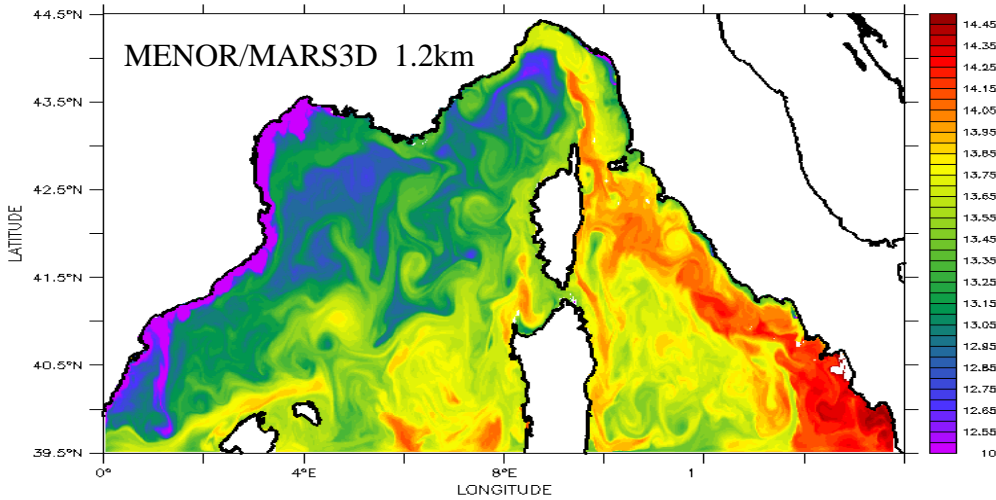

This configuration is parallelised

- Matrix is  $1100 \times 460 \times 30$
- Parallelization MPI 256 CPU
- 1 day simulated in 3 mn elapsed.

# The higher resolution of the regional model allows the modelling of mesoscale processes Not present in the OGCM

# MOON modelling network

# Menor is used for operational oceanography (PREVIMER)

<http://www.previmer.org>

In Mediterranean Sea local and regional models are embeded in a global one.

How to be consistent between the OGCM and the REGIONAL or LOCAL models ?

The OBC, IC , methods currently use in the MOON community are

- Restart (re-initialisation) from OGCM every weeks or months
- Use of a variational method (VIFOP) to avoid the shock (and decrease the spin-up time)
- MENOR is totaly free run

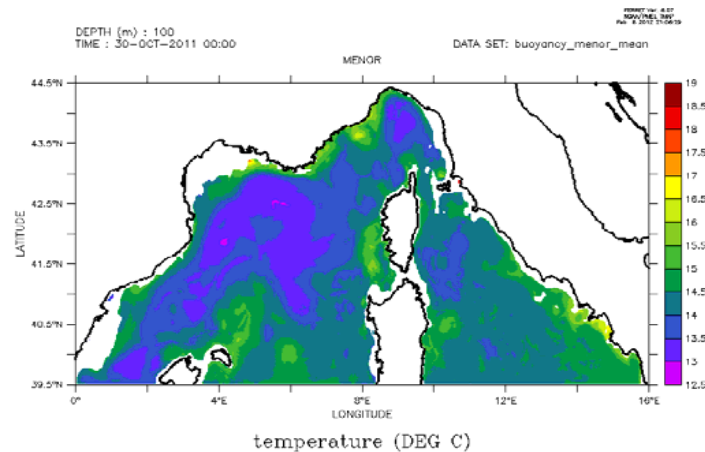

# Spectral nudging

Largely used in the atmospherical modeling  
 Already tested in oceanographic modeling (Thomson 2006)

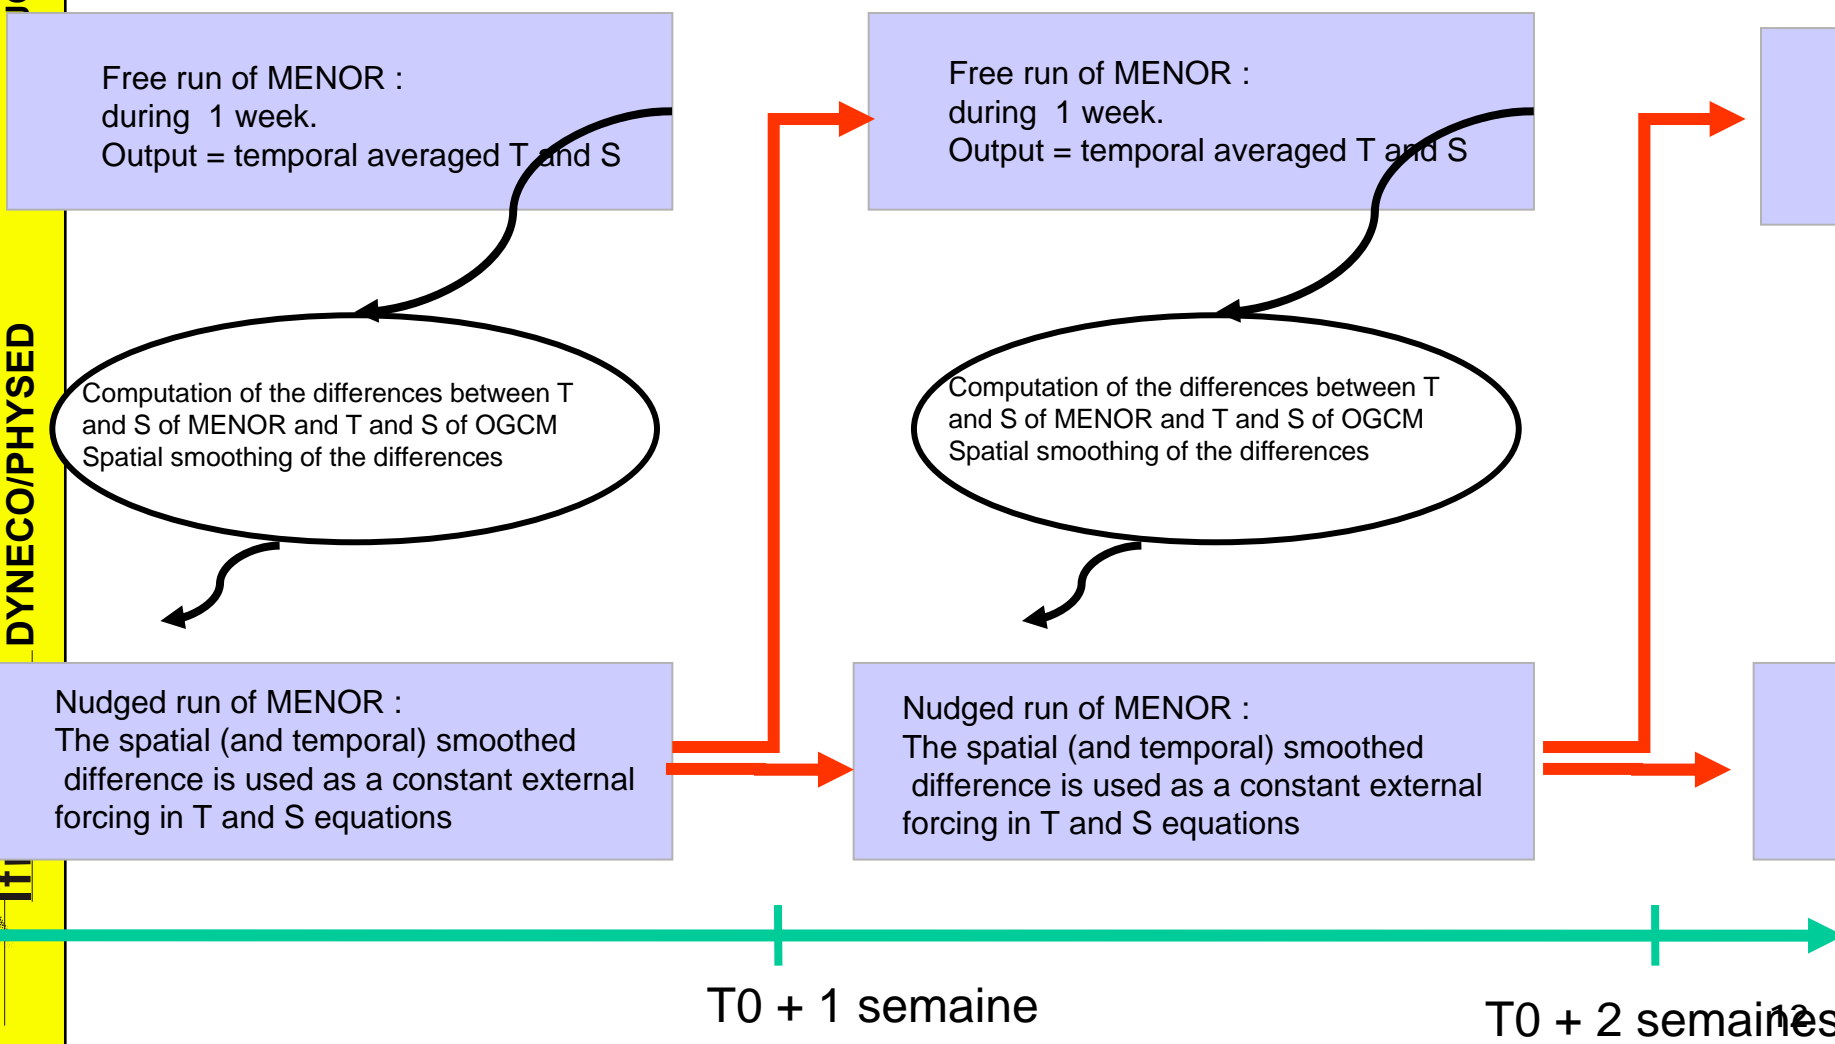

$$X(t+1) = X(t) + dt \{M(t) + INC_X(i\_cycle)\}, t_0 < t < t_0+T \longrightarrow 7 \text{ days}$$

$$INC_X(i\_cycle) = g(t) f(x,y,z) \langle \delta X \rangle$$

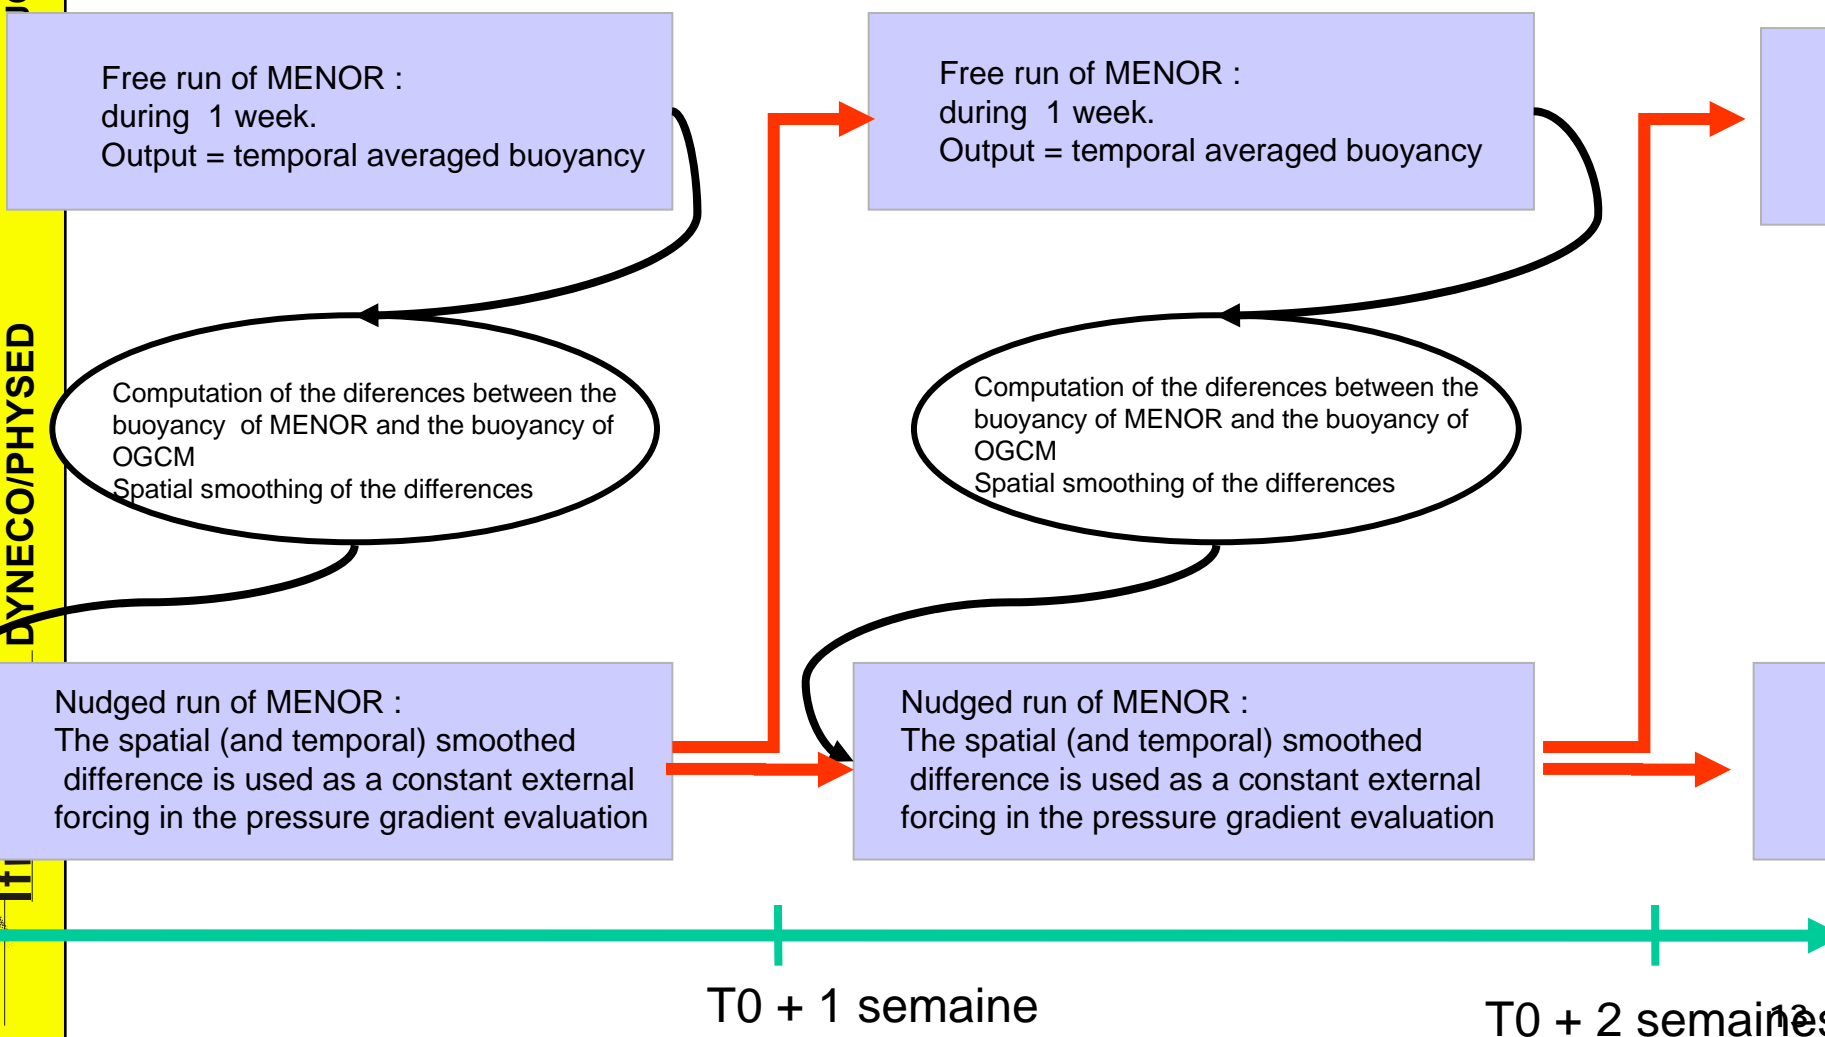

spatial and temporal Filtering

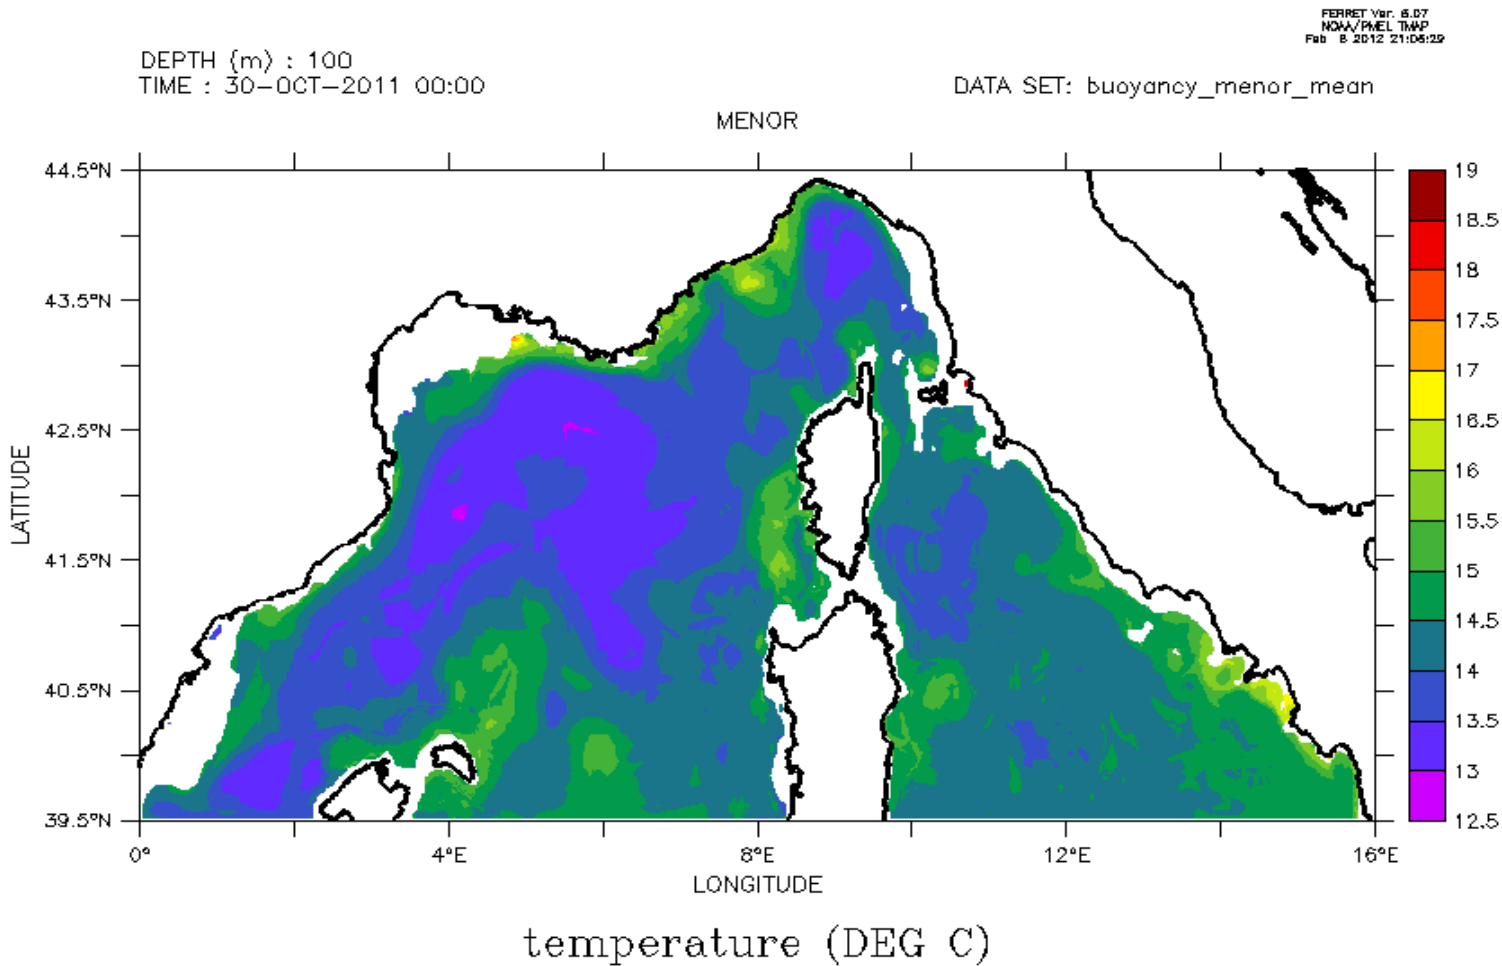

# Flow chart of spectral nudging method in T and S

# Flow chart of spectral nudging method Semi-prognostic method

# Compute the time averaged temperature (and salinity) of the free run (in a part of the domain i.e. abyssal plain )

# Evaluate the time averaged temperature (or salinity) on the same domain in OGCM

# EKE spectrum from SSH

The nudging has low impact on energy cascading

# CONCLUSION

- Spectral nudging is not intrusive in the code and easy to manage in an operational chain.
- Take advantage of the data assimilation done in OGCM.
- Usefull for regional modelling of the climate change (the regional model need to follow the heat and salt content of the OGCM)
- We have to continue the diagnostic of the nudged model.
- To be added in the Previmer chain
