Delft-FEWS Configuration Clean-up

With Delft-FEWS getting more and more modules it is recommended to regularly check your configuration on replacing old functionality with new functionality. It is also recommended to regularly check your configuration on old configuration files that have not been removed from the configuration. In the 2022.01 release of Delft-FEWS a new debug function is added to check your configuration on unused workflow and unused module configuration files.

This debug option can be started as follows:

1. Start your Delft-FEWS Stand Alone (or operator Client) application
2. Open the Maps display
3. Press F12 to start the Debug options
4. Select "P database"
5. Select "log unused workflows and module files"

A list of workflow xml files and module instance xml files will be logged, this list can then be manually removed from the configuration folder.
