

Fabric

Loading Data

To copy data to the opendap server (<http://opendap.deltares.nl> for production or <http://dtvirt5.deltares.nl> for tests) we use the [scp](#) protocol. You can copy the files manually using winscp. You can also do it in a more convenient way:

Using fabric

To be able to use fabric you need to install a few things. Follow the following steps:

- Install python (<http://www.python.org/download/>, choose 2.6 for now)
- Install setuptools (<http://pypi.python.org/pypi/setuptools#windows>)
- Add the following paths to your system path: c:\python26, c:\python26\scripts (control panel -> system -> advanced -> environment variables -> system variables -> PATH)
- Go to command window (Windows+r -> cmd)
- Type "easy_install pip"
- Type "pip install pywin32"
- Type "pip install fabric" (you need a compiler for this step) if you don't have a compiler please install cygwin or mingw.

You should now be able to type fab in the command window.

The [Fabric page](#) describes how to use it.
