

netCDF Operator (NCO)

What is NCO?

The [netCDF](#) Operators (NCO) comprise a dozen standalone, command-line programs that take [netCDF](#) files as input, then operate (e.g., derive new data, average, print, hyperslab, manipulate metadata) and output the results to screen or files in text, binary, or [netCDF](#) formats. NCO aids manipulation and analysis of gridded scientific data. The shell-command style of NCO allows users to manipulate and analyze files interactively, or with simple scripts that avoid some overhead (and power) of higher level programming environments.

See <http://nco.sourceforge.net/> for all details.

Example

This example is based on a netCDF XBeach result file ("xboutput.nc") of a 1D model with a number of variables, having a size of 12M. Of course, 12M is not that big, but you can imagine that in case of 2D and/or large numbers of simulations the file size easily becomes large. In such cases, it can be useful to leave the large original files on the network, but have a small subset containing the main results on your local drive, e.g. for plotting purposes.

In this example, the original file contains 5 hours of simulation time, a output time step of 100s, being 181 time steps. Assuming that we are mainly interested in the initial and final cross-shore profiles, we create a copy of the file, leaving out all the additional data.

The command for this is:

```
ncks -v zb -d globaltime,,,180 xboutput.nc xboutputselection.nc
```

It takes the variable (-v) "zb" with a stride of 180 of the dimension (-d) "globaltime", using "xboutput.nc" as source and "xboutputselection.nc" as destination. The headers of both files are shown below. The new file is only 14K.

Please note that the origin of the selection file stays clear by means of the history attribute.

The header of "xboutputselection.nc" looks like:

```

netcdf xoutputselection {
dimensions:
    globaltime = UNLIMITED ; // (2 currently)
    globaly = 1 ;
    globalx = 405 ;
variables:
    double globaltime(globaltime) ;
        globaltime:units = "s" ;
        globaltime:axis = "T" ;
        globaltime:standard_name = "time" ;
    double globalx(globaly, globalx) ;
        globalx:units = "m" ;
        globalx:long_name = "local x coordinate" ;
        globalx:standard_name = "projection_x_coordinate" ;
        globalx:axis = "X" ;
    double globaly(globaly, globalx) ;
        globaly:units = "m" ;
        globaly:long_name = "local y coordinate" ;
        globaly:standard_name = "projection_y_coordinate" ;
        globaly:axis = "Y" ;
    double zb(globaltime, globaly, globalx) ;
        zb:coordinates = "globalx globaly" ;
        zb:units = "m" ;
        zb:standard_name = "altitude" ;
        zb:long_name = "bed level" ;
