- [The NOOS file format](#)

## Overview

This import is available in DELFT-FEWS versions after 28-10-2008

Imports time series data in ASCII format from MATROOS Forecast databases. The import reader creates PHP URL's for direct data retrieving from Matroos. There are three types of NOOS URL's supported by the NOOS import function:

1. `get_series.php` for direct retrieval of scalar time series.
2. `get_maps1d_series.php` for retrieval of scalar time series from the Matroos maps1d database.
3. `get_map2series.php` for retrieval of scalar time series from the Matroos map data, interpolated in space

More information on the retrieval of time series from Matroos can be found on: <http://matroos.deltares.nl/direct/index.html>

For the three types of series retrieval URL's three import readers have been made in FEWS:

1. `noos_timeseries`
2. `noos_1dmapseries`
3. `noos_mapseries`

## Configuring the Import

An example of the `noos_timeseries` configuration will be given here. The reader is named **noos\_timeseries** which should be configured in the general section of the import. The general section must also contain the server URL and a correct username and password if you need to log-in. The `relativeViewPeriod` in the general section is used to select the period to retrieve data for. Special attention should be given to the timezone; FEWS retrieves all Noos data from the Matroos database in GMT.

An example import configuration is shown below:

```

<?xml version="1.0" encoding="UTF-8"?>
<timeSeriesImportRun xmlns="http://www.wldelft.nl/fews"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.wldelft.nl/fews http://fews.wldelft.nl/schemas/version1.0/timeSeriesImportRun.
xsd">
  <import>
    <general>
      <importType>noos_timeseries</importType>
      <serverUrl>http://matroos.deltares.nl/direct</serverUrl>
      <user>dummy_username</user>
      <password>dummy_password</password>
      <relativeViewPeriod unit="hour" start="-12" end="36" startOverrulable="true" endOverrulable="
true"/>
      <idMapId>IdImportMatroos</idMapId>
      <unitConversionsId>ImportUnitConversions</unitConversionsId>
      <importTimeZone>
        <timeZoneOffset>+00:00</timeZoneOffset>
      </importTimeZone>
      <dataFeedId>Matroos</dataFeedId>
    </general>
    <timeSeriesSet>
      <moduleInstanceId>ImportMatroos</moduleInstanceId>
      <valueType>scalar</valueType>
      <parameterId>H.astronomisch</parameterId>
      <locationId>hoekvanholland</locationId>
      <timeSeriesType>external historical</timeSeriesType>
      <timeStep unit="minute" multiplier="10"/>
      <readWriteMode>add originals</readWriteMode>
      <synchLevel>1</synchLevel>
    </timeSeriesSet>
  </import>
</timeSeriesImportRun>

```

## Configuring locationSet

When a locationSet or multiple time series sets are configured in the import module instance, the Noos readers will construct URL's for each time series and retrieve the data from the Matroos database sequentially. An improvement of the import readers could be to construct a more complex URL and retrieve the data for multiple time series in one URL query.

## Configuring ID mapping

The IdMapping configuration is very important because this maps the internal FEWS Id's to the Matroos Id's. In the IdMapping the following FEWS and Matroos elements are mapped:

- the FEWS **externalLocation** is used to map the Matroos **loc** or **node** element
- the FEWS **externalParameter** is used to map the Matroos **unit** element
- the FEWS **externalParameterQualifier** is used to map the Matroos **source** element

In case the **noos\_mapseries** reader is used, the FEWS **externalLocation** is used to map a few Matroos **loc** elements, namely **coordsys**, **x** and **y**.

An example IdMapping file for the **noos\_timeseries** and **noos\_1dmapseries** readers is shown below:

```

<?xml version="1.0" encoding="UTF-8"?>
<idMap version="1.1" xmlns="http://www.wldelft.nl/fews"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.wldelft.nl/fews
http://fews.wldelft.nl/schemas/version1.0/idMap.xsd">
  <map internalParameter="H.astronomisch" internalLocation="hoekvanholland" externalLocation="hoekvanholland"
externalParameter="waterlevel_astro" externalParameterQualifier="observed"/>
</idMap>

```

An example IdMapping file for the **noos\_mapseries** reader is shown below:

```

<?xml version="1.0" encoding="UTF-8"?>
<idMap version="1.1" xmlns="http://www.wldelft.nl/fews"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.wldelft.nl/fews
http://fews.wldelft.nl/schemas/version1.0/idMap.xsd">
  <map internalParameter="H.astronomisch" internalLocation="hoekvanholland" externalLocation="&
coordsys=RD&x=52670&y=449847"
      externalParameter="waterlevel_astro" externalParameterQualifier="observed"/>
</idMap>

```

## Configuring Properties

For maps1d\_series it is possible to configure further properties. Example:

### maps1d\_series example

```

<?xml version="1.0" encoding="UTF-8"?>
<timeSeriesImportRun xmlns="http://www.wldelft.nl/fews"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.wldelft.nl/fews http://fews.wldelft.nl/schemas/version1.0
/timeSeriesImportRun.xsd">
  <import>
    <general>
      <importType>noos_ldmapseries</importType>
      <serverUrl>http://matroos.deltares.nl/direct</serverUrl>
      <user>dummy_username</user>
      <password>dummy_password</password>
      <relativeViewPeriod unit="day" start="-6" end="3" startOverrutable="true" endOverrutable="true"/>
      <importTimeZone>
        <timeZoneOffset>+00:00</timeZoneOffset>
      </importTimeZone>
    </general>
    <properties>
      <bool key="ignore_ensemble" value="false"/>
      <bool key="add_current_time" value="true"/>
      <bool key="last_analysis" value="true"/>
      <bool key="use_node_id" value="false"/>
    </properties>
    <timeSeriesSet>
      <moduleInstanceId>NoosImport</moduleInstanceId>
      <valueType>scalar</valueType>
      <parameterId>discharge</parameterId>
      <qualifierId>fews_riv_ecmwf_ens_ext_hbv_rijn</qualifierId>
      <locationId>Lobith</locationId>
      <timeSeriesType>external historical</timeSeriesType>
      <timeStep unit="hour" multiplier="1"/>
      <readWriteMode>add originals</readWriteMode>
      <ensembleId>Mogyi</ensembleId>
      <ensembleMemberIndexRange start="2" end="47" />
    </timeSeriesSet>
  </import>
</timeSeriesImportRun>

```

last\_analysis is default false. If it is set to true, it adds the last analyses to the request url.

add\_current\_time is default false. If it is set to true, it adds the current time to the request url.

ignore\_ensemble is default true. If it is set to false, it will fetch the specified realizations from the database. If it is set to false, the time series configurations need to contain an <ensembleId> (can be anything, except main), and an <ensembleMemberIndex> or <ensembleMemberIndexRange>.

use\_node\_id is default false. Set it to true if you wish to configure that the query contains node\_id instead of node. The value of the node id should be the external location id.

## The NOOS file format

```
#-----  
# Timeseries retrieved from the MATROOS maps1d database  
# Created at Tue Oct 28 20:33:51 CET 2008
